Cross-country skis — Binding mounting area — Requirements and test methods

*Skis de fond — Zone de montage de la fixation — Spécifications et
méthodes d'essai*

Reference number
ISO 9119:1990(E)

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

International Standard ISO 9119 was prepared by Technical Committee ISO/TC 83, *Sports and recreational equipment*.

This first edition cancels and replaces ISO 7264:1983, ISO 7265:1984 and ISO 7793:1984.

Introduction

Standardized dimensions for a binding mounting area enable a ski designer to locate reinforcing elements within this area. Standard dimensions also enable the binding designer to determine all interface dimensions for binding unit size, screw locations, etc. Bindings and skis manufactured in compliance with this International Standard are compatible.
